Single Board Computers and their components contain very delicate Integrated Circuits (IC). To protect the Single Board Computer and its components against damage from static electricity, you should always follow the following precautions when handling it :

1. Disconnect your Single Board Computer from the power source when you want to work on the inside.
2. Hold the board by the edges and try not to touch the IC chips, leads or circuitry.
3. Use a grounded wrist strap when handling computer components.
4. Place components on a grounded antistatic pad or on the bag that came with the Single Board Computer, whenever components are separated from the system.

## **1.4 Replacing the lithium battery**

Incorrect replacement of the lithium battery may lead to a risk of explosion. The lithium battery must be replaced with an identical battery or a battery type recommended by the manufacturer.

Do not throw lithium batteries into the trashcan. It must be disposed of in accordance with local regulations concerning special waste.

## BIOS

### 3.1 BIOS Introduction

The Award BIOS (Basic Input/Output System) installed in your computer system's. The BIOS provides for a standard device such as disk drives, serial ports and parallel ports. It also adds password protection as well as special support for detailed fine-tuning of the chipset controlling the entire system.

### 3.2 BIOS Setup

The Award BIOS provides a Setup utility program for specifying the system configurations and settings. The BIOS ROM of the system stores the Setup utility.

When you turn on the computer, the Award BIOS is immediately activated. Pressing the <Del> key immediately allows you to enter the Setup utility. If you a little bit late press the <Del> key, POST (Power On Self Test) will continue with its test routines, thus preventing you from invoking the Setup. If you still wish to enter Setup, restart the system by pressing the "Reset" button or simultaneously pressing the <Ctrl>, <Alt> and <Delete> keys. You can also restart by turning the system Off and back On again.

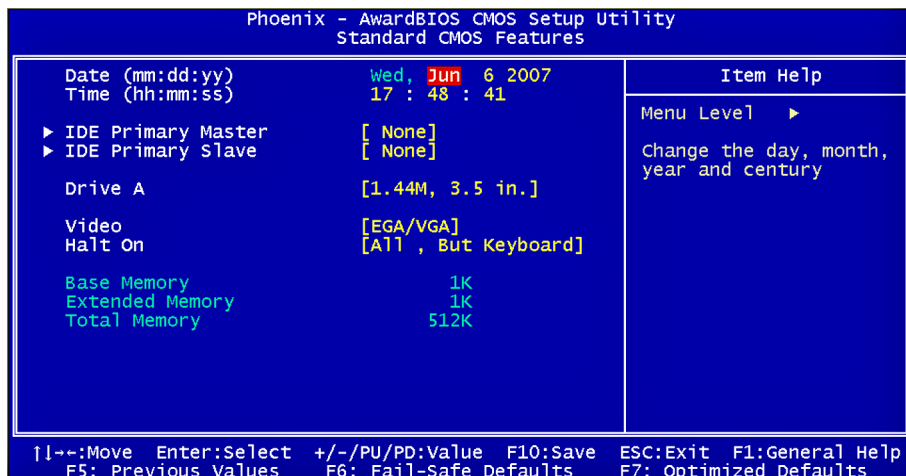

The following message will appear on the screen:

#### Press <DEL> to Enter Setup

In general, you press the arrow keys to highlight items, <Enter> to select, the <PgUp> and <PgDn> keys to change entries, <F1> for help and <Esc> to quit. When you enter the Setup utility, the Main Menu screen will appear on the screen. The Main Menu allows you to select from various setup functions and exit choices.

### 3.3 Standard CMOS Features

“Standard CMOS Features” allows you to record some basic hardware configurations in your computer system and set the system clock and error handling. If the CPU card is already installed in a working system, you will not need to select this option.

You will need to run the Standard CMOS option, however, if you change your system hardware configurations, such as onboard battery fails, or the configuration stored in the CMOS memory was lost or damaged.

#### Date

The date format is:

**Day** : Sun to Sat  
**Month** : 1 to 12  
**Date** : 1 to 31  
**Year** : 1999 to 2099

#### Time

The time format is:

**Hour** : 00 to 23  
**Minute** : 00 to 59  
**Second** : 00 to 59

To set the date & time, highlight the “Date” & “Time” and use the <PgUp>/<PgDn> or +/- keys to set the current time.

## IDE Primary HDDs

The onboard PCI IDE connectors provide Primary channel for connecting up to two IDE hard disks or other IDE devices.

Each channel can support up to two hard disks; the first is the “Master” and the second is the “Slave”.

Press <Enter> to configure the hard disk. The selections include Auto, Manual, and None. Select ‘Manual’ to define the drive information manually.

You will be asked to enter the following items.

Cylinder:	Number of cylinders
Head:	Number of read/write heads
Precomp:	Write precompensation
Landing Zone:	Landing zone
Sector:	Number of sectors

The Access Mode selections are as follows:

CHS	(HD < 528MB)
LBA	(HD > 528MB and supports Logical Block Addressing)
Large	(for MS-DOS only)
Auto	

## Drive A

It identifies the type of floppy disk drive A that has been installed in the computer. The available specifications are:

None	360K, 5.25 in.	1.2M, 5.25 in.
720K, 3.5 in.	1.44M, 3.5 in.	2.88M, 3.5 in.

## Video

This field selects the type of video display card installed in your system.

You can choose the following video display cards:

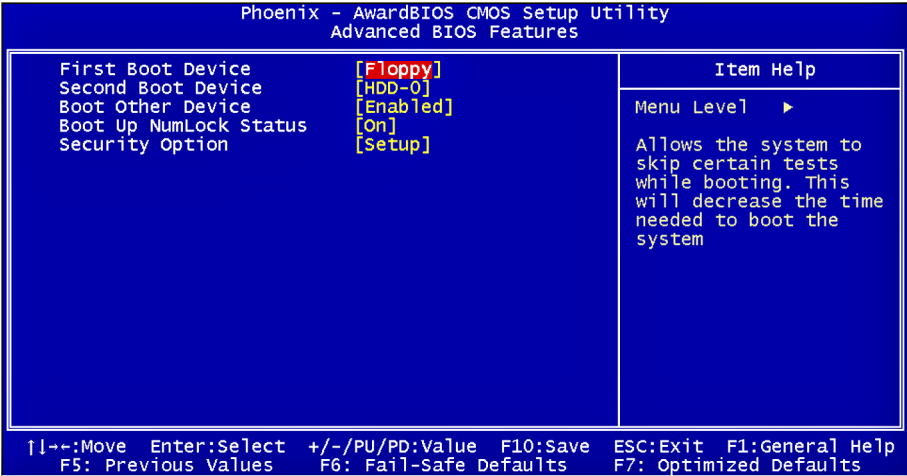

EGA/VGA	For EGA, VGA, SEGA, SVGA or PGA monitor adapters. (default)
CGA 40	Power up in 40 column mode.
CGA 80	Power up in 80 column mode.
MONO	For Hercules or MDA adapters.

## Halt On

This field determines whether or not the system will halt if an error is detected during power up.

All errors (default)	Whenever the BIOS detects a non-fatal error, the system will stop and you will be prompted.
No errors	The system boot will not be halted for any error that may be detected.
All, But Keyboard	The system boot will not be halted for a keyboard error; it will stop for all other errors.
All, But Diskette	The system boot will not be halted for a disk error; it will stop for all other errors.
All, But Disk/Key	The system boot will not be halted for a keyboard or disk error; it will stop for all others.

### 3.4 Advance BIOS Features

#### First/ Second Boot Device

These fields determine the drive that the system searches first for an operating system. The options available include  
Setting: Floppy, HDD-0, SCSI, CDROM, HDD-1, USB-FDD, USB-ZIP, USB-CDROM, USB-HDD, LAN and Disabled.

#### Boot Other Device

It allows the system to search for an OS from other devices other than the ones selected in the First/ Second/ Third Boot Device.  
Setting: Disabled, Enabled (Default).

#### Boot Up NumLock Status

It allows you to activate the NumLock function after you power up the system.  
Setting: Off, On (Default).

## **Security Option**

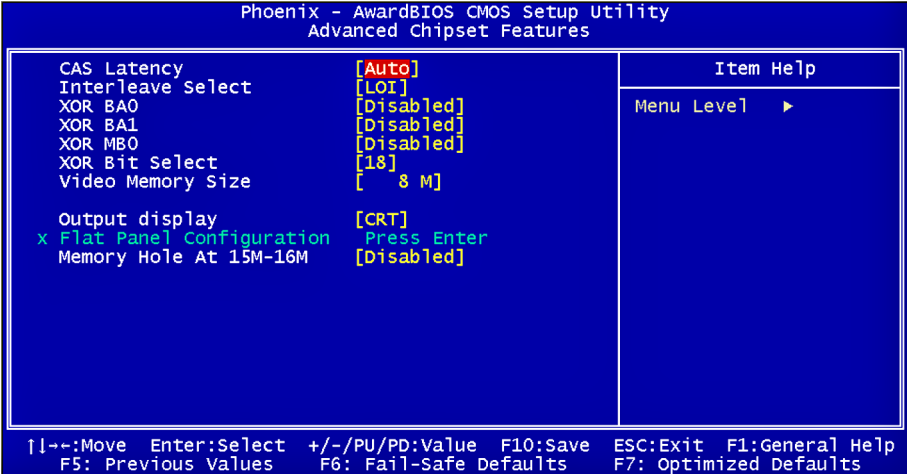

It allows you to limit access to the System and Setup.

When you select System, the system prompts for the User Password every time you boot up.

When you select Setup, the system always boots up and prompts for the Supervisor Password only when the Setup utility is called up.

Setting: Setup (Default), System.

### 3.5 Advanced Chipset Features

#### CAS Latency

It allows CAS latency time in HCLKs. The system board designer should set the values in this field, depending on the DRAM installed. Do not change the values in this field unless you change specifications of the installed DRAM or CPU.

Setting: Auto (Default), 1.5, 2.0, 2.5, 3.0, 3.5.

#### Interleave Select

It allows you to Use the Interleave Select option to specify how the cache memory is interleaved.

Setting: LOI (Default), HOI.

#### XOR BA0

Setting: Disabled (Default), Enabled.

#### XOR BA1

Setting: Disabled (Default), Enabled.

## **XOR MB0**

Setting: Disabled (Default), Enabled.

## **XOR Bit Select**

Setting: 18 (Default), 19, 20, 21.

## **Video Memory Size**

In order to determine how much memory is allocated to the video graphics device.

Setting: None, 8M (Default), 16M, 32M, 64M, 128M, 254M.

## **Output display**

In order to specify the display devices the system is connected to.

Setting: Flat Panel, CRT (Default), Panel & CRT.

## **Flat Panel Configuration**

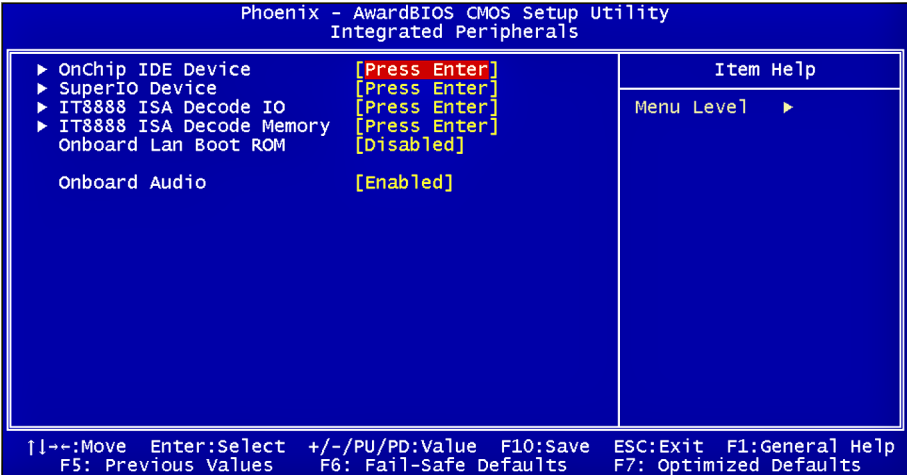

It allows you to open the Flat Panel Configuration menu.

## **Memory Hole At 15M-16M**

In order to improve performance, certain space in memory can be reserved for ISA cards. This memory must be mapped into the memory space below 16MB.

Setting: Disabled (Default), Enabled.

### 3.6 Integrated Peripherals

#### On-Chip IDE Device >>>

#### On-Chip IDE Channel 1

The integrated peripheral controller contains an IDE interface with support for two IDE channels. Select Enabled to activate each channel separately. Setting: Disabled, Enabled (Default).

#### Master/Slave Drive PIO Mode

It allows your system HDD controller to run faster. Rather than having the BIOS issue with a series of commands that transferring to or from the disk drive, PIO (Programmed Input/Output) allows the BIOS to communicate with the controller and CPU directly. When Auto is selected, the BIOS will select the best available mode. Setting: Auto (Default), Mode 0, Mode 1, Mode 2, Mode 3, Mode 4.

## IDE Primary Master/Slave UDMA

## **IRQ Wakeup Events**

The HDD, FDD, COM, LPT Ports, and PCI PIRQ are I/O events that can prevent the system from entering a power saving mode or can awaken the system from such a mode. When an I/O device wants to gain the attention of the operating system, it signals this by causing an IRQ to occur. When the operating system is ready to respond to the request, it interrupts itself and performs the service.

## Appendix-C Watchdog Timer (WDT) Setting

WDT is widely used for industry application to monitoring the activity of CPU. Application software depends on its requirement to trigger WDT with adequate timer setting. Before WDT time out, the functional normal system will reload the WDT. The WDT never time out for a normal system. Then, WDT will time out and reset the system automatically to avoid abnormal operation.

This board supports 255 levels watchdog timer by software programming. Below are the source codes written in assembly & C, please take them for WDT application examples.
